

Automox

It's not only Operating Systems that can be exploited if they aren't updated, Third-party applications are responsible for over 75% of all endpoint vulnerabilities.

Automox automates the patching process, which involves applying updates and security patches to software and operating systems on endpoints. Patch management is crucial for maintaining the security of an organization's IT infrastructure, as it helps to address vulnerabilities and protect against potential cyber threats.

Key features of Automox include:

- **Automated Patching:** Automox automates the deployment of patches and updates to endpoints.
- **Cloud-Based Platform:** Automox allows administrators to manage and monitor endpoint security from a centralized web-based console.
- **Cross-Platform Support:** It supports a variety of operating systems and software, allowing patch management across different platforms.
- **Security Configuration Management:** Automox provide tools for managing security configurations, ensuring devices adhere to security policies.
- **Endpoint Visibility:** The platform gives visibility into the security status of endpoints, helping to identify and address vulnerabilities.
- **Compliance Reporting:** Reporting features help organizations demonstrate compliance with security standards and regulations.
