SentinelOne Control endpoint protection

SentinelOne is pushed out by our Remote Machine Management (RMM) tool and installed on PCs and Macs. It communicates with its cloud-based platform to detect and respond to threats in real time.

This is called Endpoint Detection and Response (EDR). The software collects and stores detailed information about the endpoint's activity, which can be used to investigate and respond to threats.

SentinelOne Control is an endpoint security platform using a combination of

- Artificial Intelligence (AI)

- Machine Learning (ML)

- Behavioural Analytics

To give protection against malware, ransomware, and advanced persistent threats (APTs).

Benefits of using SentinelOne Control:

- Reduced risk of infection

- Faster time to remediation

- Improved visibility
